AI Prompt Specification

Project: "Meowify" — The Cat Image Replacer Browser Extension

How to use this document:

Copy the code blocks below and paste them directly into your AI coding assistant (like Cursor, v0, ChatGPT, or Claude). The prompt is heavily engineered to ensure the AI uses the correct modern standards (Manifest V3) and provides complete, ready-to-run files.

Prompt Part 1: Core Instructions

Paste this first to set the AI's role and explain the overall goal of the extension.

```
Act as an expert Chrome Extension developer specializing in Manifest V3. I want to build a fun browser extension called "Meowify". The goal of this extension is simple: when the user clicks a toggle button in the extension popup, a content script should run on the active webpage and replace EVERY image on that page with a random picture of a cat. Please write the complete code for this extension. Ensure all code follows modern Manifest V3 best practices, is clean, and includes brief comments explaining how it works.
```

Prompt Part 2: Technical Requirements

Paste this immediately after Part 1 to give the AI the exact file structure and logic required.

```
Here are the technical requirements and the files I need: 1. manifest.json: - Manifest version 3. - Name: Meowify. - Permissions needed: "activeTab", "scripting". - Set up the action popup to point to popup.html. 2. popup.html & popup.css: - A small, clean, and cute UI. - Include a header that says "Meowify Mode". - Include a prominent, styled HTML checkbox or toggle switch. - Keep the CSS embedded or in a separate file, making it look modern (rounded corners, smooth transition on the toggle). 3. popup.js: - Add an event listener to the toggle switch. - When toggled ON, use chrome.scripting.executeScript to inject the content script into the active tab. 4. content.js (The logic): - Select all <img> and <picture> elements on the page. - Loop through them and replace their 'src' and 'srcset' attributes with a random cat image URL. - Use a reliable public placeholder API for the images (e.g., https://cataas.com/cat or https://placekitten.com, optionally appending a random number query string like ?
```

Next Steps: Loading Your Extension

Once the AI generates the files for you, here is exactly how you can load your new extension into your browser to test it out.

- **Step 1:** Create a new folder on your computer and name it `Meowify_Extension`.
- **Step 2:** Copy the code generated by the AI and save it into the respective files inside that folder (e.g., `manifest.json`, `popup.html`, `popup.js`, etc.). Ensure the filenames match exactly what the AI provided.
- **Step 3:** Open Google Chrome (or any Chromium-based browser like Edge or Brave).
- **Step 4:** In the URL bar, type `chrome://extensions/` and hit Enter.
- **Step 5:** In the top right corner of the Extensions page, turn on the **Developer mode** toggle switch.
- **Step 6:** Click the **Load unpacked** button that appears in the top left.
- **Step 7:** Select the `Meowify_Extension` folder you created in Step 1.
- **Step 8:** Pin the extension to your toolbar, navigate to a heavy-image website (like a news site), click the Meowify icon, and hit the toggle!

Troubleshooting Tip:

If the extension doesn't work right away, right-click anywhere inside your extension's popup window and click "Inspect". This will open the console for the popup, where you can see if the AI made any small syntax errors, which you can easily ask it to fix!
